Remark 0.1

Partial coefficients: $\vec{Y} = \mathbf{X}\hat{\beta} + \vec{e} = (\vec{1} \quad \vec{x} \quad \vec{z})\hat{\beta} + \vec{e}$

$$y_i = \hat{\beta}_0 + \hat{\beta}_1 x_{1i} + \hat{\beta}_2 z_{1i} + e_i$$

$$y_i = b_{\vec{y}|\vec{1} \perp \vec{x}, \vec{z}} + b_{\vec{y}|\vec{x} \perp \vec{1}, \vec{z}} x_{1i} + b_{\vec{y}|\vec{z} \perp \vec{1}, \vec{x}} z_{1i} + e_i$$

New recipe for preoducing $\hat{\beta}_1$:

1. Regress \vec{y} on $(\vec{1}, \vec{z}) \rightarrow$ residuals $\vec{e}^{(y)}$
2. Regress \vec{x} on $(\vec{1}, \vec{z}) \rightarrow$ residuals $\vec{e}^{(x)}$
3. Regress \vec{y} on $\vec{e}^{(x)} \rightarrow$ resulting slope is $\hat{\beta}_1$

Fully general version (*pvariables* $\vec{x}_1, \dots, \vec{x}_p \rightarrow$ obtain $\hat{\beta}_j$

1. Regerss \vec{y} on $\vec{1}, \vec{x}_1, \dots, \vec{x}_{j-1}, \vec{x}_{j+1}, \dots, \vec{x}_p \rightarrow$ get residuals $e^{(y)}$
2. Regerss \vec{x}_j on $\vec{1}, \vec{x}_1, \dots, \vec{x}_{j-1}, \vec{x}_{j+1}, \dots, \vec{x}_p \rightarrow$ get residuals $e^{(x_j)}$
3. Regerss \vec{y} (or $e^{(y)}$) on $e^{(x_j)} \rightarrow$ slope will be $\hat{\beta}_j$

Remark 0.2

Why do this?

- Interpretation of individual $\hat{\beta}_j \leftrightarrow$ average difference in y associated with 1 unit difference in \vec{x}_j holding everything else fixed
- Alternative representation for standard error of $\hat{\beta}_j$

Remember: Under Gauss-Markov probability model $\text{Var}(\hat{\beta}) = \sigma^2(\mathbf{X}^\top \mathbf{X})^{-1} \leftrightarrow \hat{\sigma}^2 = \frac{1}{n-p+1} \sum (y_i - \hat{y}_i)^2$

$$[\text{Var}(\hat{\beta})]_{jj} = \sigma^2[(\mathbf{X}^\top \mathbf{X})^{-1}]_{jj}$$

Or use formulas from simple regression

$$\text{SE}(\hat{\beta})^2 = \frac{\sigma^2}{\sum (x_i - \bar{x})^2} = \frac{\sigma^2}{\sum (e_i^{(\vec{x}_j)} - \bar{e}^{(x_j)})^2}$$

Sidebar: Sum of squares for $\vec{x}_j \sim \vec{1}, \vec{x}_1, \dots, \vec{x}_p$ except for \vec{x}_j

$$\|\vec{x}_j - \bar{x}_j \vec{1}\|^2 = \text{RegSS} + \|e^{(\vec{x}_j)}\|^2$$

$$\text{We know } R^2 = \frac{\text{RegSS}}{\text{TotSS}} \Rightarrow \text{ErrSS} = \text{TotSS}(1 - R^2)$$

$$\text{Var}(\hat{\beta}_1) = \frac{\sigma^2}{\sum (\vec{x}_j - \bar{x}_j \vec{1})^2 (1 - R_j^2)} \cdot \frac{\sigma^2}{\sum (\vec{x}_j - \bar{x}_j \vec{1})}$$
